# Coronavirus (COVID-19) infection survey (antibodies data): 19 to 25 April 2021

Analysis of the proportion of people in Wales testing positive for COVID-19 antibodies for 19 to 25 April 2021.

First published: 13 May 2021

The antibody data presented is part of the Coronavirus (COVID-19) Infection Survey (CIS) which is run across the whole of the UK. The data can be used to identify individuals who have had the infection in the past or have developed antibodies as a result of vaccination.

The analysis presented on past infection and/or vaccination, is defined as testing positive for antibodies to SARS-CoV-2 based on findings from the COVID-19 Infection Survey. SARS-CoV-2 is the scientific name given to the specific virus that causes COVID-19.

Estimates of antibody positivity presented in this publication have been produced using a new model. Further information on the new method used to model antibody estimates can be found on the ONS website.

This publication also includes estimates of the percentage of people who have reported via the survey that they have received one or more doses of a COVID-19 vaccination, as well as those that have been fully vaccinated. These estimates are not the same as the published figures from **Public Health Wales** on recorded vaccinations and do not include residents of care homes.

Further information on these changes, along with estimates of antibody positivity broken down by age for each of the UK countries can be found on the **Office for National Statistics website**.

# Proportion of people in Wales who had antibodies against COVID-19

Between 19 and 22 April 2021, 63.2% (95% **credible interval**: 58.8% to 68.3%) of people aged 16 and over tested positive for antibodies to the coronavirus (COVID-19).

Though there is uncertainty with the estimates, it appears that the percentage of people testing positive for antibodies has levelled off slightly following an increasing trend in antibody rates. This may be due to the estimates not yet showing the impact of individuals receiving their second vaccination doses.

As more people become vaccinated the number of people with antibodies is expected to increase. However the detection of antibodies alone is not a precise measure of immunity protection acquired from vaccinations.

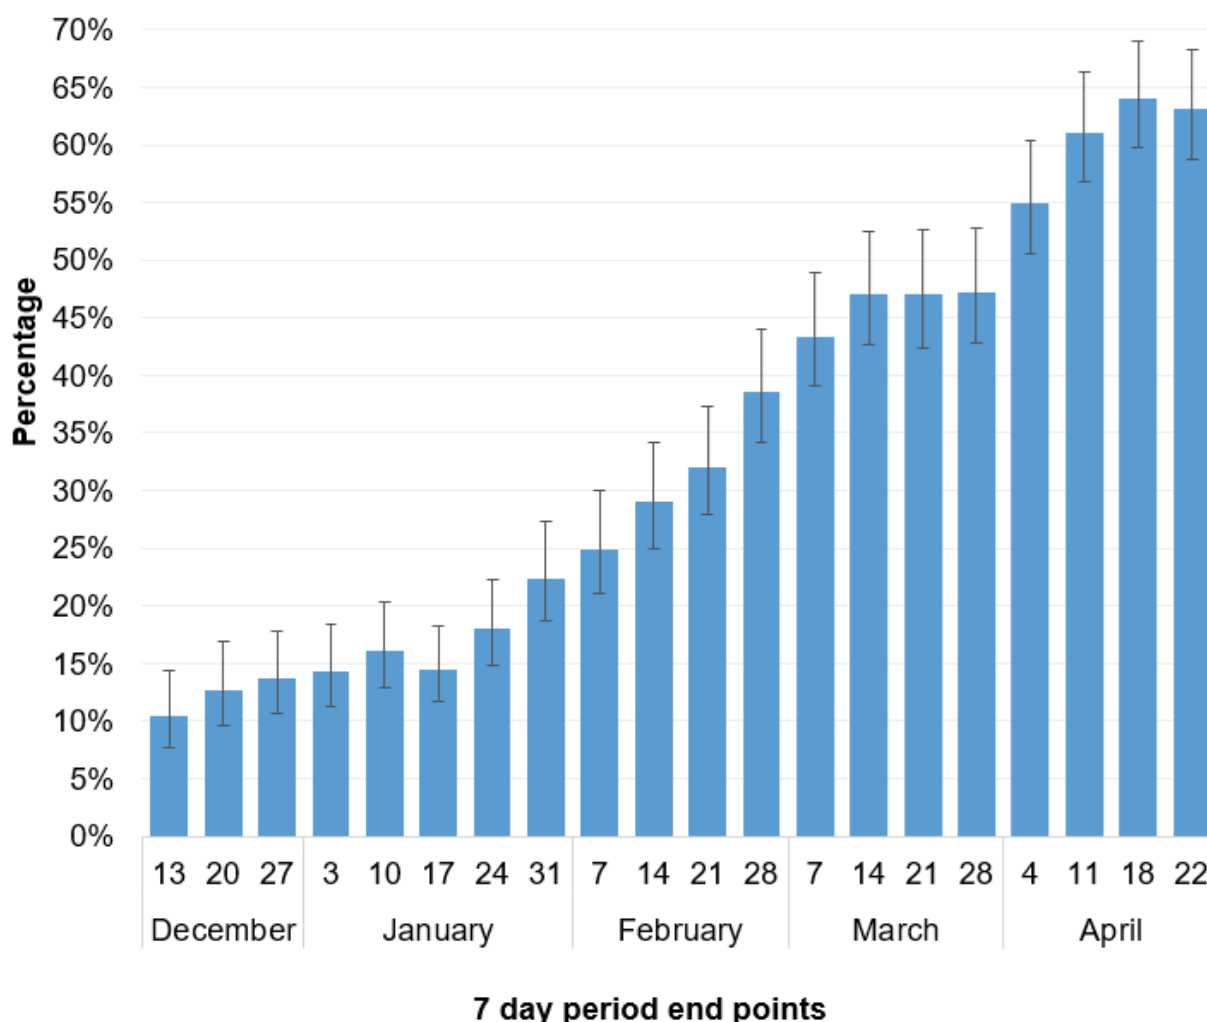

Antibody levels in the blood can decline over time, meaning that some people who have previously had COVID-19 may subsequently test negative for antibodies. For this reason, these figures should be regarded as estimates of monthly antibodies prevalence, not cumulative exposure.

# Chart 1: Estimated percentage of the population in Wales testing positive for coronavirus (COVID-19) antibodies, December 2020 to April 2021

Source: Coronavirus (COVID-19) Infection Survey, ONS

The blue bars give point estimates and the vertical lines indicate the 95% credible intervals. Estimates shown for 7 day periods from 7 December 2020 to 22 April 2021.

The modelled estimates suggest that whilst the antibody rate appears to have levelled off slightly, the percentage of people reporting they have had at least one dose of a COVID vaccine or have been fully vaccinated continues to increase.

Between 19 and 25 April, 67.4% of people aged 16 and over reported to have

Get [information on copyright](#).

had one or more doses of a COVID-19 vaccine (95% **credible interval**: 64.2% to 71.3%), with more than a quarter reporting they had been fully vaccinated.

The vaccinations estimates are not the same as the published figures from **Public Health Wales** on recorded vaccinations and do not include residents of care homes. There will be differences between these modelled estimates and the official figures due to differences in coverage, methods and timeliness. The estimates produced from the survey are helpful to compare with other characteristics, such as testing positive for antibodies.

## Chart 2: Estimated percentage of the population in Wales reporting receipt of vaccination and testing positive for coronavirus (COVID-19) antibodies from 7 December 2020 to 25 April 2021\*

Source: Coronavirus (COVID-19) Infection Survey, ONS

\*Antibody data is covering a period from 7 December to 22 April

The blue line and shading represent the modelled trend and 95% credible intervals for people testing positive for antibodies (dark blue) and people reported having had at least one dose of a COVID vaccine (blue) or that they were fully vaccinated (light blue).

Between 19 and 22 April, a higher percentage of people tested positive for antibodies in the age groups over 50 than the younger age groups. It is estimated that more than 80% of people tested positive for antibodies across these older age groups, and more than 90% for those aged 80 years or older.

The percentage of people testing positive for antibodies for those aged 16 to 49 years ranged from 38.1% to 47.5%. For those aged 50 years and over, antibody positivity ranged from 81.0% to 90.4%.

It is noticeable that the percentage of people reporting they have had at least one dose of a COVID vaccine was highest in the older age groups. This is also the case for those reporting they have been fully vaccinated.

Caution should be taken in over-interpreting the latest estimates. Credible intervals are wide and the sample size is relatively low, meaning there is higher uncertainty in these figures.

### Chart 3: Estimated percentage of the population in Wales reporting receipt of vaccination and testing positive for coronavirus (COVID-19) antibodies by age group, 5 to 11 April 2021

Source: Coronavirus (COVID-19) Infection Survey, ONS

\*Antibody data is covering a period from 19 to 22 April

The bars give estimates for people testing positive for antibodies (blue) and that reported having had at least one dose of a COVID vaccine (dark blue) or to have been fully vaccinated (light blue). The horizontal lines indicate the 95% credible intervals.

Between 19 and 22 April, 66.4% of females tested positive for antibodies (95% credible interval: 62.1% to 71.4%), compared to 59.7% of males (95% credible interval: 55.3% to 65.0%).

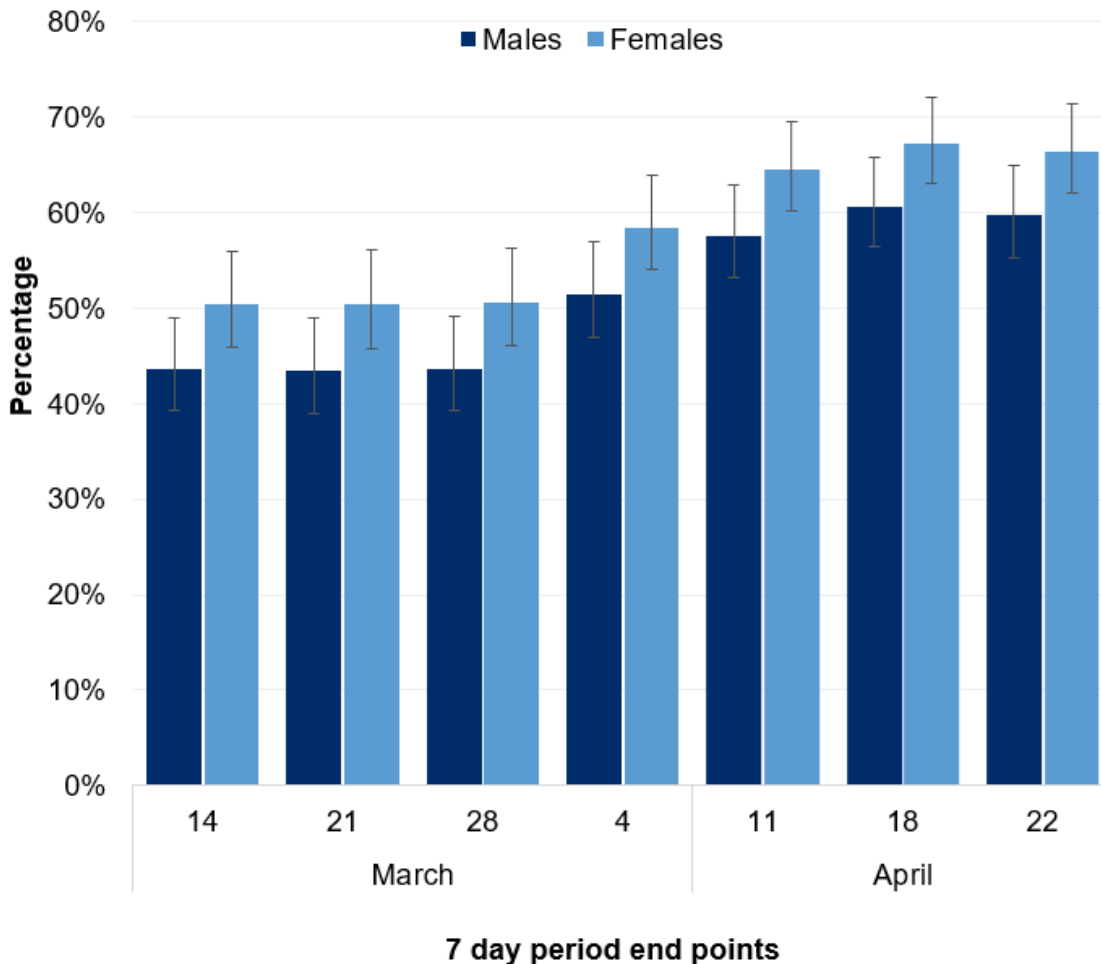

Overall women had higher rates than men, and this is broadly consistent across the age groups.

# Definitions

## Community population

This survey covers people living in private households only and this is referred to as the community population. Residents in hospitals, care homes and/or other institutional settings are excluded.

## Credible intervals

A credible interval gives an indication of the uncertainty of an estimate from data analysis. 95% credible intervals are calculated so that there is a 95% probability of the true value lying in the interval.

## Positivity rate

The estimated proportion of people who test positive for antibodies against coronavirus (COVID-19) at a point in time.

## Surveillance weeks

These are standardised Monday-Sunday weeks, which are used internationally and are useful for comparability. However this approach sometimes results in estimates referring to a period of fewer than 7 days if the full week's data is not available.

## Quality and methodology information

Estimates of antibody positivity presented in this publication have been produced using a **new model**. The new model is based on standardised Monday-Sunday surveillance weeks, as opposed to the 28-day periods previously reported on, enabling more timely weekly estimates to be produced.

This document was downloaded from GOV.WALES and may not be the latest version.

Go to <https://gov.wales/coronavirus-covid-19-infection-survey-antibodies-data-19-25-april-2021-html> for the latest version.

Get [information on copyright](#).

Estimates based on the new model are presented from 7 December 2020 onwards. The final week's modelled estimate is subject to more uncertainty as it is an incomplete week of data and therefore more likely to change when more data becomes available.

The analysis presented is based on blood test results taken from a randomly selected subsample of individuals aged 16 years and over, which are used to test for antibodies against SARS-CoV-2. This can be used to identify individuals who have had the infection in the past or have developed antibodies as a result of vaccination.

One way the body fights infections like COVID-19 is by producing small particles in the blood called antibodies. It takes between two and three weeks after infection or vaccination for the body to make enough antibodies to fight the infection. Antibodies remain in the blood at low levels, although these levels can decline over time to the point that tests can no longer detect them. Having antibodies can help to prevent individuals from getting the same infection again.

The presence of antibodies is measured to understand who has had coronavirus (COVID-19) in the past and the impact of vaccinations. Once infected, the length of time antibodies remain at detectable levels in the blood is not fully known. It is also not yet known how having detectable antibodies, now or at some time in the past, affects the chance of getting COVID-19 again.

This publication also presents self-reported estimates of the percentage of people who have received one or more doses of a COVID-19 vaccination since 14 December 2020. These estimates are based on modelling of the people visited in the COVID-19 Infection Survey in the community in a particular time period. The estimates are then adjusted (post-stratified) to be representative of the population.

These estimates are not the same as the **published government figures** on recorded vaccinations and there may be differences between these modelled estimates and the official figures, which are updated more regularly. The estimates produced from the survey are helpful to compare with other characteristics, such as testing positive for antibodies.

The [UK coronavirus dashboard](#) includes daily data for the UK and each constituent country on the actual number of people who have received a COVID-19 vaccination. This is based on individual vaccination records (administrative data held by each nation) and should be used to understand progress of the vaccination programme across the UK.

Antibody data presented is a week behind vaccination data as there is a time lag on when antibody data is received, whereas vaccine data is self-reported and more readily available.

These statistics refer to infections reported in the community, by which we mean private households. These figures exclude infections reported in hospitals, care homes and/or other institutional settings. The population used in this analysis relates to the [community population](#) aged 16 years and over.

It is important to note that there is a significant degree of uncertainty with the estimates. This is because, despite a large sample of participants, the number of positive cases identified is small. Estimates are provided with 95% [credible](#) intervals to indicate the range within which we may be confident the true figure lies.

Further information on antibody test results is published by the [Office for National Statistics \(ONS\)](#) and includes antibody information for England, Wales, Scotland and Northern Ireland. The estimates for [Northern Ireland](#) and [Scotland](#) are published by the respective administrations, as we do here for Wales.

Further information about quality and methodology can be found on the [ONS website](#) and the survey pages on the [Oxford University site](#).

seven wellbeing goals for Wales. These are for a more equal, prosperous, resilient, healthier and globally responsible Wales, with cohesive communities and a vibrant culture and thriving Welsh language. Under section (10)(1) of the Act, the Welsh Ministers must (a) publish indicators ('national indicators') that must be applied for the purpose of measuring progress towards the achievement of the wellbeing goals, and (b) lay a copy of the national indicators before Senedd Cymru. The 46 national indicators were laid in March 2016.

Information on the indicators, along with narratives for each of the well-being goals and associated technical information is available in the [Wellbeing of Wales report](#).

Further information on the [Well-being of Future Generations \(Wales\) Act 2015](#).

The statistics included in this release could also provide supporting narrative to the national indicators and be used by public services boards in relation to their local wellbeing assessments and local wellbeing plans.
