Introduction

This is the seventh indicators report since the revision in March 2009 of Woodlands for Wales, the Welsh Government’s strategy for woodlands and trees.

The 23 indicators aim to monitor progress towards achieving the 20 high level outcomes described in Woodlands for Wales, and correspond to the list found on pages 54 and 55 in the strategy document. The first 6 indicators aim to monitor changes in the area and nature of Welsh woodlands and trees, while the remaining 17 aim to monitor the goods and services which woodlands and trees can provide: most are composed of a number of measures. Many of the indicators relate to more than one of the 20 high level outcomes: this is shown in a table at the end of the report. Some of the indicators show progress both for the Welsh Government Woodland Estate (WGWE) and for woodlands in general.

Data sources for the measures are shown, together with the desired and apparent trend for each indicator and baseline information where available. Accompanying commentary sets out the relevance, key points and any notes for each indicator to give context to the data. As this work is still in progress there are several indicators which are under development. As some aspects of woodlands and trees change slowly, some indicators are not updated every year, but instead every two, three, or five years, in line with the reporting programme of the National Forest Inventory and the Natural Resources Wales survey schedule.

Building on the 2001-2005 progress report, published in 2006 and based on the original Woodlands for Wales published in 2001, where possible indicators have been developed so that trends can be followed for the full 50-year lifespan of the strategy.
1. Woodlands and trees

Key points

- From 2001 to 2010 the estimated area of woodland cover in Wales remained fairly constant at between 289,000 ha and 284,000 ha, although there was an increase in the proportion of broadleaf compared to conifer woodland. Most recent data estimates that woodland cover in Wales is currently 306,000 ha, an increase on the 2010 figure. Much of this increase, in particular the increase in estimated cover between 2010 and 2011, can be attributed to improved measurement techniques rather than increase in the actual amount of woodland.
- Since 2001, the estimated area of conifer woodland in Wales has decreased by 18,000 ha, while the estimated area of broadleaf woodland has increased by 35,000 ha.
- The length of woody linear features seems to have remained roughly stable; no trend data as yet on individual trees outside woodland is currently available.
- The rate of new planting has fallen back in recent years and in the year to 31 March 2016 141 hectares (102 hectares of broadleaves and 39 hectares of conifers) were planted.

Data

a) Area of woodland

Chart 1: Area of woodland in Wales split by woodland type

Source: Forestry Statistics

Since 2001, the estimated area of conifer woodland in Wales has decreased by 18,000 ha, while the estimated area of broadleaf woodland has increased by 35,000 ha. However the estimated proportion of conifer and broadleaf woodland has stayed approximately the same since 2012.
b) New woodland planting

The rate of new planting increased between 2009 and 2014 but in recent years it has fallen back. In the year to 31 March 2016 there was some conifer planting (39 ha) and the majority of planting was broadleaf planting (102 ha). Funding towards the cost of establishing new woodland under the Glastir Woodland element of the Rural Communities – Rural Development Programme 2014-2020 is coming on stream and will stimulate new planting, the rate of which will be monitored in the next and subsequent Woodlands for Wales Indicators releases.

Chart 2: Area of new woodland planting per year by woodland type

![Chart showing area of new woodland planting per year by woodland type]

Source: Forestry Statistics

c) Number of trees and length of linear features

The National Inventory of Woodlands and Trees (1997) provides baseline information on the number of trees and length of linear features, such as hedges, relict hedges and lines of trees, outside woodland.

Table 1: Trees and linear features outside woodland

<table>
<thead>

<td>15.3 million</td>
</tr>
<tr>
<td>Total length of linear features</td>
<td>14,568 km</td>
</tr>
</tbody>
</table>

Source: National Inventory of Woodlands and Trees

The Countryside Survey uses a different methodology to report on the length of linear features, though it makes no estimate of the number of individual trees. This survey reports no significant change between 1998 and 2007 in overall length of woody linear features, although there has been
a significant decrease in the length of managed hedges and a concurrent increase in the length of relict hedges/ lines of trees/ shrubs/ fence (see Table 2).

Source: Countryside Survey

**Relevance**

This indicator gives information on the overall level of the resource of woodlands and trees in Wales. One of the desired outcomes of the strategy is that woodland cover in Wales increases, particularly through the creation of new native woodland and new mixed woodland. This is, in part, to ensure that the overall production potential of Welsh woodlands is maintained. More woodland cover is also needed to provide the full range of ecosystem services including community benefits envisaged in the strategy, and contribute towards both achieving the well-being goals put in place by the Well-being of Future Generations (Wales) Act 2015 and delivering against the framework for natural resource management that has been put in place by the Environment (Wales) Act 2016.

Another desired outcome of the strategy is that there is better protection for individual trees and that more individual trees are planted in recognition of their contribution to ecosystem services and our quality of life.

**Note**

The initial results of the NFI 2010 were published for Wales in March 2011 and this estimated the area of woodland in Wales to be about 20,000 ha more than was estimated in 2010 (see Chart 1). The vast majority of the difference is a result of improvements in technology used in the releases between the National Inventory of Woodlands and Trees (1995 – 1999) and the NFI 2010, rather than being due to unrecorded woodland planting or natural regeneration. Data from the Small Woods Survey reporting canopy cover from woods of less than 0.5 ha, lone trees, trees in hedge rows and hedgerows will be available to update Indicator 1 in next year’s release.
2. Diversification of woodlands

Key points

- In 1997, conifer woodland was dominated by single species stands
- In conifer planting between 1991 and 1997, planting was dominated by Sitka spruce (63% of all conifer areas planted), and 80% of areas planted were of four main species – Sitka spruce, Japanese/hybrid larch, Norway spruce and Douglas fir.

Data

a) Woodland diversity at the catchment scale

This section covers 3 catchment areas of Wales: the Dee River Basin District; the Severn River Basin District; and the Western Wales River Basin District. More detail on Woodland diversity at the catchment scale for these areas can be found by clicking the following link.

Dee River Basin District

Map 1: Dee River Basin District

![Map of Dee River Basin District](image)

Source: NFI estimates for woodland in catchment areas in Wales

Figure 1 shows that in the Dee River Basin District the most common woodland trees are Sitka spruce trees (27%), the next most common trees in this area are Birch trees (12%), and the third most common being Hawthorn trees (10%).
Figure 1: Principal tree species composition by stocked area at 31 March 2012 – Dee River Basin District

Source: NFI estimates for woodland in catchment areas in Wales

Severn River Basin District

Map 2: Severn River Basin District

Source: NFI estimates for woodland in catchment areas in Wales

Figure 2 shows that in the Severn River Basin District the most common woodland trees are Sitka spruce trees (17%), the next most common trees in this area are Oak trees (11%), and the third most common being Hawthorn trees (10%).
Figure 2: Principal tree species composition by stocked area at 31 March 2012 – Severn River Basin District

Source: NFI estimates for woodland in catchment areas in Wales

Western Wales River Basin District
Map 3: Western Wales River Basin District

Source: NFI estimates for woodland in catchment areas in Wales
Figure 3 shows that in the Severn River Basin District the most common woodland trees are Sitka spruce trees (30%), the next most common trees in this area are Oak trees (11%), and the third most common being Ash trees (8%).

**Figure 3: Principal tree species composition by stocked area at 31 March 2012 – Western Wales River Basin District**

All three catchment areas appear to have a good diverse range of trees; however they all have large clusters of certain tree species such as Sitka spruce, Ash and Birch trees.

**b) Woodland habitat diversity index at 1 hectare scale**

This index distinguishes between different species of trees. A score of 0.0 means that only one species is present in the 1 ha square of woodland. At present only baseline data for 1997 from the National Inventory of Woodlands and Trees are available, but this will be updated when the results of the NFI enable.
c) Intimate mixtures: Number of tree species present per quarter hectare

As with the previous indicator, the available data provides a baseline for 1997, and will be updated using data from the National Forest Inventory.
d) Planting

The following graph shows the range of conifer species planted in Wales in High Forest Category 1 areas by planting year. These are the stands which are, or could become, capable of producing wood of a size and quality suitable for sawlogs. These figures include restocking and new planting.

Chart 5: Conifer High Forest Category 1 species

In conifer planting between 1991 and 1997, planting was dominated by Sitka spruce (63% of all conifer areas planted, although this is a decrease of 14% from the period before), and 80% of areas planted were of four main species — Sitka spruce, Japanese/hybrid larch, Norway spruce and Douglas fir. Although it should be noted that the area of conifer high forest category 1 species decreased from the period ending 1970 in comparison to the period ending 1997.

e) Genetic base

Further work is required to develop, if feasible, an indicator which can monitor the genetic diversity of stock being planted in Wales.

Relevance

This indicator monitors the diversity of woodlands in Wales at different scales, and looks at the range of tree species being planted. One of the desired outcomes of the strategy is the appropriate diversification of woodlands, particularly of non-native woodlands, at a range of scales, in terms of age structure, tree species, and genetic base. The desired trends are:

- Increasing diversity of woodland types both at a catchment and a woodland scale
- Increasing area of non-native woodlands with intimate mixtures
- Planting becoming less dominated by single species
- Planting of a wider genetic base
Notes
Updates for a), b) and c) can be expected as data from the National Forest Inventory becomes available.
3. Sustainable woodland management

Key points

- The total area of woodland known to be managed to the UK Forestry Standard has increased from 123,000 ha in 2001 to an estimated minimum of 172,000 ha in 2015. The total area managed to the UKFS is likely to be higher.

Sources: Forestry Statistics, Natural Resources Wales and Welsh Government databases on woodlands in grant schemes

As it is impossible to tell whether areas within grant schemes are also certified, it is not possible to be sure of the total area of woodland managed to the UKFS, but a minimum and maximum estimate is shown below.

Chart 6: Estimated woodland area managed to the UKFS

Source: Forestry Statistics, Natural Resources Wales and Welsh Government

Relevance

This indicator monitors the area of woodland in Wales which is known to be managed to the UK Forestry Standard (UKFS), including area of woodland certified to FSC or PEFC. One of the goals of the strategy is to bring more woodland, including many small and fragmented woodlands, into management to the UFKS and capable of providing usable timber and other services. Beyond this, the goal is to see more Welsh woodlands gaining certification to the UK Woodland Assurance Standard.
4. Management system

Key points

- Overall, the area of woodland known to be managed without clearfell has increased but this increase has levelled off and decreased in the past year
- The area of woodland known to be managed by clearfell has decreased in overall terms

Data

Chart 7: Estimated woodland area managed with and without clearfell

*The way the area of woodland managed without clearfell was calculated changed in 2009.*

Source: Welsh Government, Natural Resources Wales and Forestry Statistics

Relevance

One of the desired outcomes of the strategy is that woodlands are better adapted to deliver a full range of benefits, and to achieve this outcome, one of the goals is that clearfell is avoided where alternative management systems would make a better contribution to ecosystem services. This indicator monitors the area of woodland in Wales that is managed without use of clearfell. The desired trends are:

a) A decrease in the area managed by clearfell
b) An increase in area actively managed for timber by other systems

Note

The management of woodland areas (chart 7) has been estimated using data from the NRW grants database and GIS database. Areas where management is unknown may include areas managed with or without clearfell as well as areas not actively managed. In the past year, the decrease in the area of woodland managed without clearfell and the corresponding increase in the area where management is unknown is largely attributed the unavailability of woodland management grant under the Rural Communities Rural Development Plan.
5. Farm woodland

Key points

- The amount of farm woodland within a grant scheme has shown an increase since 2000, however since 2013 the amount of farm woodland within a grant scheme has begun to decrease.

- Only a small proportion of farmers are harvesting their woodland for timber or firewood to sell. Approximately two-thirds of farmers with woodland do not harvest timber or firewood from their woodland. This result should be treated with caution because of the different survey methodologies that have been used (Chart 9).

Data

a) Area of farm woodland within a grant scheme

**Chart 8: Farm woodland within a grant scheme**

Source: Welsh Government and Natural Resources Wales databases.

Tir Gofal contracts ended in 2014 and some of the area of farm woodland previously managed under that scheme is likely to now be managed under the Glastir woodland grant scheme causing the large Tir Gofal decrease and the large Glastir increase over the last year.

b) Proportion of farmers who are harvesting firewood or timber

This data comes from three different sources: the data for 2009 comes from Forestry Commission Wales (FCW) survey of farmers with woodland on their farms; the data for 2012 comes from the Forestry Resource Study carried out by Mid Wales and the Marches Assessment Centre on behalf of FCW; and the 2015 data comes from the Agricultural and Horticultural Survey for Wales. Because of this, the data may not be directly comparable due to differences in survey methods and questions.
Chart 9: Harvesting from farm woodlands

Source: Forestry Commission Wales Survey of Farmers, Forestry Resource Study, Welsh Agricultural and Horticultural Survey

Chart 9 shows that over the last 6 years around 61% of farm woodland has not been harvested, whilst around 39% of farm woodland is harvested every year.

Relevance

There are approximately 78,000 ha of woodland on farms in Wales (Source: estimates from the Welsh Agricultural Survey, June 2015) – about a quarter of all woodland in Wales. One of the goals of the strategy is that farmers have better support in managing their woodlands and trees to provide ecosystem services and diversify their businesses. This indicator monitors the area of farm woodland within a grant scheme and the proportion of farmers who are managing their woodlands for timber products, including firewood. The desired trends are:

a) Increase in area of farm woodland within a grant scheme,

b) Increase in proportion of farmers harvesting firewood and timber from their woodlands, or generating income from woodlands in other ways.

Note

Amount of farm woodland in Tir Gofal has been estimated and methodology may not be comparable between 2011 and 2012.
6. Urban woodland and trees

Key points

- The apparent increase in canopy cover between 2006 and 2009 can be mostly explained by photography in 2009 having an increased resolution, enabling better identification of woodland and trees.
- There are generally higher levels of cover in the Valleys and lower levels in coastal towns.
- Over nine-tenths (91%) of people named at least one benefit of urban trees, while over half (58%) named at least one disadvantage.

Data

a) Urban Canopy Cover:

These data look at areas identified as ‘urban’ by NRW’s ‘Tree Cover in Wales’ Towns and Cities’ report. Overall canopy cover for towns in Wales is shown below.

<table>
<thead>
<tr>
<th>Year</th>
<th>Urban Area (ha)</th>
<th>Tree Canopy* (ha)</th>
<th>Canopy Cover* %</th>
</tr>
</thead>
<tbody>
<tr>
<td>2006</td>
<td>84,331</td>
<td>12,568</td>
<td>15%</td>
</tr>
<tr>
<td>2009</td>
<td>86,331</td>
<td>14,636</td>
<td>17%</td>
</tr>
<tr>
<td>2013</td>
<td>86,331</td>
<td>14,097</td>
<td>16%</td>
</tr>
</tbody>
</table>

Source: *Tree Cover in Wales’ Towns and Cities (2016)*

* Previous releases have referred to Woodland as opposed to Tree Canopy. Percentages rounded.

The 2,068 ha increase in canopy cover between 2006 and 2009 is likely to be due to improved aerial photographic resolution rather than the additional cover being recruited during the period. Comparisons between 2009 and 2013 using the same aerial photographic resolution indicates a decline in canopy cover of 539 ha across Wales.

The levels of canopy cover for the urban areas of Local Authorities in Wales are shown below.
Different types of towns are identified as having different levels of canopy cover. Below are levels of canopy cover for 
Cardiff - the capital city, Port Talbot – a heavily industrial town, Pontypool – a Valleys town, and Rhyl – a northern 
coastal town.

**Table 5: Canopy cover in selected towns**

<table>
<thead>
<tr>
<th>Town</th>
<th>Urban Area (ha)</th>
<th>Tree Canopy (ha)</th>
<th>Canopy Cover (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cardiff</td>
<td>8,421</td>
<td>1,302</td>
<td>15.50%</td>
</tr>
<tr>
<td>Port Talbot</td>
<td>2,302</td>
<td>188</td>
<td>8.20%</td>
</tr>
<tr>
<td>Pontypool (&amp; Abersychan)</td>
<td>1,203</td>
<td>277</td>
<td>23.00%</td>
</tr>
<tr>
<td>Rhyl</td>
<td>659</td>
<td>36</td>
<td>5.50%</td>
</tr>
</tbody>
</table>

The data suggests that there are generally higher levels of canopy cover in the Valleys and lower levels of canopy cover in coastal towns. The towns included in Table 5 are typical of these areas.
b) Perceptions of the benefits and disadvantages of urban trees:

**Chart 11: Benefits of urban trees**

[Bar chart showing benefits such as improved road safety, useful by-products, increase in property values, just knowing they are there, health benefits, help reduce air and noise pollution, help soak up water in rainy weather, pleasant places to meet and mix with people, connection with nature, enhancement of shopping areas, shade helps cool area during summer, help people feel more relaxed and calm, places for birds and wildlife to live, and make area look more attractive.]

Source: Public Opinion of Forestry Survey

**Chart 12: Disadvantages of urban trees**

[Bar chart showing disadvantages such as leaves and branches being messy/hazardous, damage to buildings, hiding views, the trees not being properly looked after, the trees making the roads less safe, reduce light to nearby buildings, the trees not being properly looked after, hide views, damage buildings, provide opportunities for criminal activity, cannot control what happens to the street trees, carrying out work causing disruption and mess, problems with TV reception and solar panels, the trees are not good for wildlife, worsen the landscape, block development, not good for wildlife, providing opportunities for criminal activity, harbour pests, and other issues.]

Source: Public Opinion of Forestry Survey
The Public Opinion of Forestry Survey indicates that the most popular benefit of urban trees was that they “make the area look attractive”, whilst the most popular disadvantage was that urban trees drop “leaves and branches that are hazardous and messy”.

Relevance
One of the desired outcomes of the strategy is that urban woodlands and trees deliver a full range of benefits, with more creative use of opportunities for planting woodlands and trees in new developments and in the restoration of brownfield sites to provide people with better quality easily accessible green space. This indicator monitors the area of urban woodland.

As this outcome is delivered, shifts in perceptions of the benefits that urban trees bring would be expected. The second part of this indicator monitors these perceptions using data collected from the biennial Public Opinion of Forestry Survey.
7. Carbon balance

Key points

- Current sequestration from Welsh woodlands is estimated to be about 1,419 gigagrams (1,419,000 tonnes) annually.
- Forestry is predicted to remain a net sink for atmospheric carbon.

Data

Carbon emissions and removals

The chart below shows historic and projected carbon emissions under various scenarios: “Business As Usual” (“BAU”), high, mid and low, as described in the report ‘Projections to 2050 of emissions and removals from the LULUCF sector in Scotland, England, Wales and Northern Ireland’. Emissions of CO2 are shown as positive quantities and removals are shown as negative quantities. Under all scenarios, forestland remains a net sink for emissions during the time to 2050.

Source: 2013/14 projections to 2050 of emissions and removals from the LULUCF sector in Scotland, England, Wales and Northern Ireland, H. Malcolm et al
Relevance

One of the desired outcomes of the strategy is that Welsh woodlands contribute to reducing the carbon footprint of Wales. This indicator monitors carbon stocks in woodland biomass and wood products, and carbon abatement due to product and fuel substitution. The desired trends are an increase in carbon stocks and also in carbon abatement.

Note

The carbon sequestration of woodland has been recalculated, taking into account sequestration from woodlands planted before 1920. This has increased the amount of sequestration, which has been retrospectively calculated for the past as well as the future.
8. Tree health

Key points

- Since 2010, there have been outbreaks of two quarantine diseases affecting tree species in Wales (Phytophthora ramorum and Chalara fraxinea).
- A Wales specific Phytophthora ramorum disease management strategy was launched in December 2013 which establishes management zones.
- There are also a small number of non-quarantine pests and diseases known to be affecting tree species in Wales. Recent findings of Acute Oak Decline and Sirococcus tsugae on Atlas Cedars and Neonectria on Noble fir are of note.

Data

**Ramorum disease in larch**

The map on the next page shows the Phytophthora ramorum outbreaks in Welsh woodlands. Between 2003 and 2009, there were 51 reported cases of the quarantine disease P. ramorum in Wales, all affecting shrubs such as rhododendron in nurseries, garden centres and some open garden sites. The outbreak was thought to have been satisfactorily controlled. However, since 2009 the disease has been found infecting and killing large numbers of Japanese larch trees, first in South-West England, and since 2010 in Wales. Currently, outbreaks in Wales are largely, but not entirely, confined to the southern half of the country and often on the Welsh Government Woodland Estate (WGWE). However, larch trees throughout Wales are considered to be at risk. Natural Resources Wales, the Forestry Commission, Forest Research, and the Animal and Plant Health Agency (APHA) are working together to survey, study and manage the disease.

The outbreak of the disease has increased. At the end of 2012 there were 2,700 hectares of larch affected. By March 2016 there had been a dramatic increase to 8,661 ha of larch affected. This is a lower figure than reported in last year’s release and due to the remapping Statutory Plant Health Notices along trunk roads. There was a slowdown in the spread of the disease in 2014 and 2015 mostly likely as a result of the prevailing weather patterns during the previous summer/autumn.

The Core Disease Zone (“CDZ”) established as part of the disease management strategy for Phytophthora ramorum was amended in January 2014. There were no further amendments to the CDZ in 2014 or 2015.
Map 4: Distribution of *P. ramorum* in Wales

*Dosbarthiad o Phytophthora ramorum yng Nghymru*/

*Wedi’i Diweddarau ar 31st Mawrth 2016/Updated 31st March 2016*

Source: Natural Resources Wales
Chalara dieback of ash (Hymenoscyphus fraxineus)
This disease has already affected a high proportion of ash trees in many Northern European countries. It was discovered for the first time in Britain in a nursery in Buckinghamshire in February 2012. In October 2012, it was also found in the wider environment in woodland in the east of England and South Wales.

It is potentially a very serious threat, having caused widespread damage to ash populations in continental Europe, including estimated losses of between 60 and 90 percent of Denmark's ash trees. There is no reason to believe that the consequences of its entering the natural environment in Britain would be any less serious. Experience on the continent indicates that it kills young ash trees very quickly, while older trees tend to resist it for some time until prolonged exposure causes them to succumb as well.

Chalara is treated as a quarantine pest under national emergency measures and any suspected sighting must be reported. NRW has carried out surveys of recently planted sites to identify the extent of the disease in nursery trees.

Chalara ash dieback has now been found across much of Wales. Survey work has focused on identifying the 10km grids where there is no evidence of the disease (see map 5). The 2015 survey showed that 30% of the 10km grid squares showed some signs of the disease which was mainly confined to younger trees along road sides and hedgerows.
Map 5: Distribution of Chalara Ash Dieback in Wales

Source: Natural Resources Wales
**Dothistroma Needle Blight**
This is an economically important disease affecting conifers, particularly Corsican Scots and Lodgepole pine, of which there are about 14,000 ha in Wales. The disease decreases timber yield and very heavy infections can kill the trees. It started to spread in the late 1990s and by 2006 had infected 70% of Corsican pine stands in Britain. A survey on the WGWE in 2012 has shown that over 80% of Corsican pine stands, about 30% of Scots pine stands and 3% of Lodgepole pine stands are infected.

**Bleeding Canker of Horse Chestnut**
This is a disease affecting horse chestnut which started to spread in the 1970s and by 2007 was found to have infected 36% of horse chestnuts in Wales. The disease initially causes disfigurement of trunks and branches but can eventually kill the tree.

**Map 6: Reports of Acute Oak Decline**

Acute Oak Decline
There are a number of confirmed infections on individual trees along the Wales border and a wider spread of unconfirmed but suspicious cases further across Wales (see Map 6). This disease is a major future threat which needs to be monitored.

**Green Spruce Aphid**
The Green Spruce aphid (Elatobium abietinum) caused considerable defoliation of on spruce across much of Wales during 2015. During the summer months, the aphid feeds on needles that are over one year old leaving the new needles untouched. During the winter, if the aphid is still active, it will attack needles of all ages, resulting in complete defoliation in severe cases.

This aphid does not kill the tree outright, but in extreme cases will cause a slowdown in growth (productivity) and possibly weaken the tree, leaving it vulnerable to attack by other pests and diseases.

**Sirococcus blight or Cedar Blight**
Since 2013, severe shoot blight and defoliation of Atlantic cedar has been reported from a range of locations in Britain. The cause was identified by Forest Research as Sirococcus tsugae in late 2013. The fungus can cause up to 70% defoliation and if the cankers affect the main stem (and it is girdled), the tree might die.

 Cedars and Hemlocks are valuable ornamental and forestry species in the UK. Although much uncertainty remains concerning the geographical distribution of biology and potential impact of S. tsugae in the UK, it has the potential to cause damage to valuable ornamental trees in public and
private gardens and economic losses, in particular for the nursery sector. During 2015, a number of cedar trees were found to be infected, particularly in north-east Wales.

Protected Zone Surveys
A number of surveys have been carried out across Wales in order maintain the GB Protected Zone Status for a range of species. The species monitored for including a number of bark beetles, Oak Processionary Moth, Chestnut Blight and Oriental Chestnut Gall Wasp. Additionally, surveys have been carried out under EU emergency measures for Pinewood nematode and Pitch pine canker. No findings of any of the above species have been found.

Citizen Science
The Observatree Project is a UK based project supported by European funding with the aim to protect the UK’s trees, woods and forests from new pests and diseases. The project has trained a number of volunteers across Wales to act as a means of early warning alert for new pests and diseases. The volunteers are trained by Forest Research Scientists and NRW field staff and supported by the Woodland Trust. Volunteers have been actively surveying Welsh Woodlands.

Relevance
One of the desired outcomes of the strategy is that woodland ecosystems are healthy and resilient. There are concerns that with climate change there may be more frequent outbreaks of pests and diseases, deterioration of the condition of some of our tree species, and more winter storm damage. This indicator will monitor reports of pests, disease, and damage to trees in Wales. Since changes in disease outbreaks, tree condition and windthrow are largely out of our control, this indicator also looks at the effectiveness of our response to pest and disease outbreaks.
9. Local benefits of woodlands

Key points

- The percentage of people naming at least one benefit of woodlands has decreased by 4 percentage points, since 2009.
- The percentage of people naming at least one disadvantage of woodlands has decreased by 5 percentage points, since 2009.
- Over nine-tenths (94%) of people named at least one benefit of woodlands to local communities, while nearly two-fifths (38%) named at least one disadvantage.

Data

Since 2005, the Public Opinion of Forestry Survey has asked respondents about their perception of benefits of woodlands to local communities, and since 2009 has asked about their perception of disadvantages of woodlands. Since 2013, new questions have been asked about the respondents’ perceptions of the benefits and disadvantages of urban trees.

a) Changes in the perception of benefits to local communities:

**Chart 15: Benefits of woodlands to local communities**

Source: Public Opinion of Forestry Surveys
b) Changes in the perception of disadvantages to local communities:

Chart 16: Disadvantages of woodlands to local communities

- Place for criminal activity
- Traffic on roads
- No local jobs
- Other pollution
- No nice place to visit
- Noise pollution
- Can't get firewood
- No access
- Climate change
- Other pollution
- Worsens landscape
- Not good for wildlife
- Timber lorries
- Blocks development
- Other

Source: Public Opinion of Forestry Surveys

Chart 17: People naming at least one benefit or disbenefit

Source: Public Opinion of Forestry Surveys

*Question not asked in 2005
c) Benefits and disadvantages of urban trees:

94% of respondents to the last Public Opinion of Forestry Survey identified at least one benefit of woodlands to local communities, while 38% identified at least one disadvantage. The most popular benefit of woodlands chosen was that they provide ‘Places for wildlife to live’, whilst the most popular disadvantage chosen was that woodland provide a ‘place for criminal activity’ to occur.

Relevance

Four of the desired outcomes of the strategy are that (i) woodlands are better adapted to deliver a full range of benefits, (ii) urban woodlands and trees deliver a full range of benefits, (iii) more communities benefit from woodlands and trees, and (iv) more people enjoy the life-long learning benefits of woodlands and their products.

As these outcomes are delivered, shifts in the perceptions of the benefits that local woodlands and urban trees bring to communities would be expected. This indicator monitors those perceptions using data collected from the biennial Public Opinion of Forestry Survey. The desired trends are that:

   a) More people name several benefits of woodland to their local community
   b) Higher percentages of people name individual benefits
   c) Lower percentages of people name individual disadvantages
   d) More people name benefits of urban or street trees

Notes

For more detail on the data regarding urban trees, see 6. Urban Woodlands and Trees.
10. Community involvement

Key points

- The 2015 Public Opinion of Forestry Survey indicated a sizeable increase in the percentage of households involved in woodland education, increasing by 9 percentage points from 2013. Also the percentage of adults involved in volunteering in the woodlands had increased by 2 percentage points between 2013 and 2015.
- There has been stability in the percentage of people consulted on woodland plans, and the percentage of members of woodland community groups.
- Our latest data shows that there was a large increase in the area of land leased or owned community groups between 2008 and 2010.
- There has been a decrease in the numbers of woodland community groups but an increase in the area of land they lease, own or manage.

Data

Relevance

Two of the desired goals of the strategy are that more communities are involved in decision making about woodlands, and management of woodlands so that woodlands deliver greater benefits at a community level and that more people of all ages benefit from the use of woodland as a setting for learning and play. This indicator monitors the proportion of the population getting involved in woodlands.
11. Recreation

Key points

- The 2015 Public Opinion of Forestry Survey indicates that 64% of adults surveyed in Wales had visited woodland for recreation in the last 12 months.
- About half (52%) of all outdoor visits include time spent in woodland.
- The most popular activity reported in 2014 was walking.
- Woodlands were the second most favoured main outdoor destination.

Data

a) Proportion of adults visiting woodlands 2003-2015

Chart 18: Percentage of adults who have visited woodland in the last 12 months

In 2015, 64% of adults surveyed in Wales had visited woodland in the last 12 months which was the same as in 2013; however it is 15 percentage points below the figure of 79% recorded in 2007. Of the respondents who had visited woodland in the last 12 months, almost two thirds (64%) visited woodlands in the countryside on their most recent visit rather than woodlands in and around towns. The most commonly stated reason given by respondents who had not visited woodlands in the last 12 months was that they were too busy / they didn’t have enough time.

b) Types of activities undertaken in woodlands

The Wales Outdoor Recreation Survey was first run in 2008, and repeated in 2011 and 2014. In 2011, woodland was the main place visited in 18% of the respondents’ most recent visits, in 2014 this had decreased to 15%. However, in 2014 woodlands were the second most favoured main outdoor destination overall, behind local parks only. 12% of respondents said they would like to visit woodland more often (compared to 13% in 2011). Future demand for visits to woodland was of more interest to respondents with children (15%) and those in the bottom 10% most deprived areas (19%). About half (52%) of outdoor visits taken by the survey participants most recently included time spent in woodland, a gradual increase from 2008 (36%) and 2011 (41%).
- Woodland visits were more likely to be taken by those aged 16-24 (57%), those living in North Wales (56%), dog owners (56%), those who were employed (56%) and men (56%).
- Woodlands had a much lower percentage of expenditure by visitors than the average at 23% of visits compared to the average of 42%. Levels of expenditure were highest during visits to the sea (74% of visits). Food and drink (30%) and fuel (18%) accounted for the highest categories of spending.

**Chart 19: Activities undertaken outdoors in 2014 in last 12 months**

Source: Wales Outdoor Recreation Survey

While the popularity of most activities seems to have remained roughly stable it should be noted that walking has continued to be the most frequently undertaken activity. It was particularly likely to be undertaken by people who had children in the household (93%), dog owners (90%) and those in paid employment (92%). The only activities to record an increase in participation from 2011 were running and swimming outdoors. All of the other activity percentage points stayed approximately the same or decreased.

**Relevance**

One of the desired outcomes of the strategy is that more people live healthier lives as a result of their use and enjoyment of woodlands. This indicator looks at the use of woodlands for passive and active recreation.

**Notes**

The wording of the Public Opinion of Forestry Survey was modified in 2015 to focus on visits that had taken place in the last 12 months rather than during the last few years (which was the wording
of the previous survey). Therefore, some of the results for 2015 are not directly comparable with figures from earlier surveys.
12. Accessibility

Key points

- 64% of respondents to the last Public Opinion of Forestry Survey said that they have easy access to woodland without a car or other transport.
- The percentage of people who say they have easy access to woodland without a car has remained roughly stable over the last 10 years.
- The percentage of people with access to a 20 ha+ woodland within 4km has risen steadily between 2004 and 2012.

Data

a) Summary data

Chart 20: Percentage of adults who have easy access to woodland without a car

Source: Public Opinion of Forestry Surveys; no data available for 2007

The Woodland Trust’s Woodland Access Standard aspires that everyone should have access to at least 2ha of woodland within 500m of their home and to at least 20ha of woodland within 4 km of their home. The data below show the extent to which this has been achieved so far in Wales.

Chart 21: Percentage population with access to woodland

Source: Space for People, Woodland Trust
The table below shows large increases in the percentage of the population with access to 2ha+ of woodland within 500m of their homes and access to 20ha+ of woodland within 4km of their homes from 2004 to 2012.

### Table 8: Urban area with access to woodland

<table>
<thead>
<tr>
<th></th>
<th>Percentage of urban area, 2004</th>
<th>Percentage of urban area, 2009</th>
<th>Percentage of urban area, 2012</th>

<td>97 98.4 98.2</td>
</tr>
<tr>
<td>Rhondda Cynon Taff</td>
<td>32 36.6 35.5</td>
<td>99.9 99.8 99.8</td>
</tr>
</tbody>
</table>

Source: Space for People, Woodland Trust

Blaenau Gwent and Merthyr Tydfil both had large percentage point increases in population with access to 2ha+ wood within 500m of their homes between 2004 and 2012, whilst Neath Port Talbot had a large percentage point decrease.

Interestingly Neath Port Talbot was the only county to have an overall percentage point increase in population with access to 20ha+ wood within 4km of their homes between 2004 and 2012 out of the 4 counties in the table above.

### Relevance

One of the desired outcomes of the strategy is that more people live healthier lives as a result of their use and enjoyment of woodlands, and one of the goals is to encourage the development and promotion of woodland access throughout Wales with suitable infrastructure and well managed woodlands which feel safe and welcoming. This indicator looks at the availability of woodlands with public access, and can be analysed by geographic area.
13. Local enterprises

Key points

- Employment in the forestry sector and the number of business units has remained roughly stable in recent years.
- Between 8,500 and 11,300 people work in the forestry sector in Wales.

Data

Table 10: Current estimates of employment in the forestry sector

Source: Business Register and Employment Survey (BRES), using UK Standard Industrial Classifications

In addition to this, the Annual Population Survey shows that there may be a further 2,000 self-employed people working in the sector (this data is based on a low number of responses to the survey and is categorised as being of low quality). In total, the number of people working in the sector may be up to 13,100.

To put these figures in context, the total number of people estimated to be employed in the forestry sector across the UK as a whole is 133,300 with perhaps another 29,900 self-employed. This means that about one-thirteenth of all people working in the UK forestry sector work in Wales.

Chart 22: Changes in employee numbers

Source: Business Register and Employment Survey, using UK Standard Industrial Classifications
**Chart 23: Changes in number of businesses**

Source: Business Register and Employment Survey (BRES), using UK Standard Industrial Classifications

**Relevance**

One of the desired outcomes of the strategy is that more people benefit from woodland related enterprises, and one of the goals is that more people operate businesses, develop skills and create jobs in enterprises associated with woodland and timber. This indicator uses data from the Office of National Statistics to monitor:

- number of woodland-related enterprises in Wales including both VAT registered and non-VAT registered businesses;
- approximate employment by these enterprises; and
- approximate numbers of self-employed people working in the sector.

**Notes**

It should be noted that businesses other than those included in the sectors above can be considered to be supported wholly or partially by forestry; however at present the SIC classifications used do not allow us to include these businesses. In particular, no estimate has been made of the number of persons employed in woodland based recreation businesses.

All figures relating to Business units were last updated in 2015, whilst employee numbers were last updated in 2014.
14. Use of Welsh wood

Key points

- The proportion of available softwood harvested this year remained at an acceptable level, however the softwood harvest to availability ratio over the last 10 years is slightly too high (86 per cent and it should be below this figure.)
- Over 60% of Welsh sawlogs are processed in sawmills in Wales

Data

a) Total harvest/availability ratio

Chart 24: Timber harvested

Source: Forestry Statistics, Forestry Commission Production Forecast, analysis of data from the National Inventory of Woodland and Trees

The key things to note from the Chart 24 are that Harwood availability decreased in 2013 which is explained in the note section, and that since 2008 both the demand and availability of softwood have increased.

Table 11: Harvest/availability ratios

<table>

Source: Forestry Statistics
Table 12 shows that since 2010 the tonnage of Welsh saw logs supplied to sawmills in the UK has increased and Chart 26 shows that the percentage of Welsh sawlogs processed in Wales has stayed relatively constant over the 10 year period between 2005 and 2014, staying between 63 and 69 percentage points.

c) Source of timber inputs to primary and secondary timber processors in Wales (2010 baseline)

The charts above show that primary processors in Wales tend to source a high proportion of timber from Wales; yet secondary processors in Wales source the majority of their timber from abroad.

Relevance

One of the desired outcomes of the strategy is that more Welsh-grown timber is used in Wales. Delivery of this outcome will also help with another: that Welsh woodlands contribute to reducing the carbon footprint of Wales. This indicator monitors the proportion of available wood which is
harvested (taken from softwood availability forecasts), and proportion processed in Wales to gain added value. The desired trends are that:

a) Total harvest to availability ratio increases, but primarily through the increased harvest of hardwood.

b) Softwood harvest to availability ratio is kept below 86% on 10 year average and annually within the range 77%-98%.

c) The proportion of Welsh wood processed in Wales increases.

Note
Before 2013, the hardwood availability forecast was estimated using data from the NIWT. A more accurate 50 year hardwood availability forecast has since been developed. This forecast gives a much lower availability of hardwood than was previously supposed, and is the reason for the apparent dramatic increase in the hardwood harvested/availability ratio and decrease in hardwood availability.
15. Value of forestry sector

Key points
- The most recent data indicates that the Total GVA of the forestry sector is £528.6 million.
- The GVA of the forestry sector has risen in the last few years and is now higher than it was in 2005.
- The GVA of the forestry sector in Wales has both fallen and risen more sharply than that of the UK in general.

Data

Table 13: Gross Value Added (GVA) of the forestry sector in Wales

Chart 29: Change over time in Gross Value Added (GVA)

Source: Annual Business Survey, Annual Population Survey and Regional Accounts, Office for National Statistics
The chart below shows a comparison of the GVA of the forestry sector in Wales with that in the UK as a whole, using 2005 as a base year.

Chart 30: Gross Value Added (GVA) of forestry sector in Wales compared to UK

Source: Annual Business Survey, Annual Population Survey and Regional Accounts, Office for National Statistics

Relevance
One of the desired outcomes of the strategy is that the forest sector is better integrated and more competitive, supporting the Welsh economy. This indicator looks at the contribution of the forestry sector to the Welsh economy, using estimates of Gross Added Values from data provided by the Office for National Statistics.

Notes
It should be noted that businesses other than those included in the sectors above can be considered to be supported wholly or partially by forestry; however at present the SIC classifications used do not allow us to include these businesses. In particular, no estimate has been made of the GVA of woodland based recreation businesses.

A new methodology was used to calculate figures in the 2013-14 report and so these figures (and future figures) should therefore not be compared with figures in reports preceding 2013-14.
16. Demand for wood

Key points

- UK apparent consumption of wood is 55 million m\(^3\) wood raw material equivalent.
- UK apparent consumption of wood has decreased overall since 2007; however it has begun to increase since 2012.
- Even though UK apparent consumption of paper has decreased overall since 2002, the consumption of sanitary and household papers has gradually increased over the period.

Source: Forestry Statistics

*UK apparent paper consumption for 2015 reports single figure for 'graphic papers' and 'newsprint'; for comparison purposes the previous years figures have been amalgamated

**Relevance**

One of the desired outcomes of the strategy is that there is increased use of timber as a key renewable resource. This indicator monitors the demand for wood products in the UK; data for Wales are not currently available.
17. Business health in the forestry sector

Key points

- Over the three years 2007-2010, just over a third of businesses saw a decrease in turnover, with just under a third reporting an increase.
- Four-fifths of businesses did not report any change in employment.
- The majority of enterprises were confident in the future of their business.

Data

a) Perception of past performance

The charts below show the results of the most recent survey of woodland enterprises, carried out in 2010, which asked businesses to say whether their turnover had increased or decreased in the last three years.

**Chart 32: Businesses reporting change in turnover 2007 – 2010**

Source: Forestry Commission Wales survey of woodland enterprises

The survey also asked businesses whether the number of people they employed had increased or decreased over the last three years.

The survey of woodland enterprises produced worrying results in that the majority of woodland enterprises produced a lower turnover in 2010 than in 2007 and employed fewer people in 2010 than 2007.
This compares to previous surveys done in 2007 and 2004 as shown below.

### Table 16: Change in turnover for businesses 2001-2010

b) Expectations for future years

### Chart 34: Business confidence for the years 2010 – 2013

Source: Forestry Commission Wales survey of woodland enterprises
Chart 34 suggests that most businesses in 2010 expected that the number of market opportunities would’ve increased by 2013, leading to a higher expected turnover shown in Chart 35, however the actual results are unknown till another survey is released.

Chart 35: Businesses’ expectations of turnover for the years 2010 – 2013

Source: Forestry Commission Wales survey of woodland enterprises

c) Obstacles identified by enterprises

For timber-related businesses, the main obstacles to business identified in the survey were rising costs of equipment, timber and fuel (identified by 15%), the economic climate (identified by 15%), and a lack of demand for their product (identified by 7%). Four percent of enterprises said that a lack of timber was a major obstacle.

For woodland recreation enterprises, the major obstacles to business identified in the survey were the economic climate (identified by 22%), followed by a lack of finance, grants or loans (11%). Five percent of recreation enterprises said that lack of access to woodland was an obstacle.

Relevance

Two of the desired outcomes of the strategy are that there is a thriving, skilled workforce in the forestry sector and that the forest sector is better integrated and more competitive, supporting the Welsh economy. This indicator looks at the health of the forestry sector in terms of business outlook, obstacles and opportunities. The data come from the Forestry Commission Wales survey of woodland enterprises 2010. This indicator is being revised and refreshed data will be presented in the 2016-17 release.
18. Woodland habitats and ancient trees

Key points
- The current picture of woodland features in Special Areas of Conservation (SACs) is predominantly unfavourable.

Data

a) Area of native woodland and area of restored Plantations on Ancient Woodland Sites (PAWS)

In 1997, there were 109,500 ha of native woodland in Wales, according to the National Inventory of Woodlands and Trees. It is anticipated that updated National Forest Inventory (NFI) data will be available to refresh this indicator in next year’s Woodlands for Wales indicators release.

b) Improving condition of native woodland

The 1997 baseline for condition of native woodland is reported here. This will be updated when data from the NFI field survey becomes available.

Table 17: Condition of native woodland

<table>
<thead>
<tr>
<th>Condition indicator</th>
<th>Value</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mean shrub layer cover as percentage of native woodland</td>
<td>30</td>
<td>This is expected to remain stable or increase in the long term. Mean shrub layer cover in Wales is higher than that recorded for Scotland perhaps due to lower grazing pressure.</td>
</tr>
<tr>
<td>Mean number of tree/shrub species per quarter hectare of native woodland</td>
<td>4.27</td>
<td>This is expected to remain stable or increase in the long term.</td>
</tr>
<tr>
<td>Mean volume of deadwood in native woodland (m$^3$ per hectare)</td>
<td>0.6</td>
<td>This is far below the volume of 20m$^3$ per ha required to comply with the UK Woodland Assurance Standard, and also falls below the 4.4m$^3$ per ha recorded for Scotland</td>
</tr>
<tr>
<td>Percentage of (i) native woodland and (ii) oak woodland in old growth stage</td>
<td>(i) 23, (ii) 39</td>
<td>In the long term, it is expected that there will be an increase in the proportion of native woodland falling into the old-growth category. However, extensive areas of new native woodland planting could cause the proportion to dip in the short to medium term.</td>
</tr>
</tbody>
</table>

Source: Analysis of data from the National Inventory of Woodlands and Trees

c) Improving condition of woodland on designated sites

NRW has been monitoring the condition of SAC woodland features in Wales. The table below includes information on the most recent condition assessment for all sites and for condition assessments undertaken in the period 1 January 2010 to 31 December 2015. There may be significant
lag between completion of monitoring and the final reporting of feature condition meaning data may change as final assessments are completed.

Source: Natural Resources Wales

* Notes to Table 19: (a) habitats are assessed and assigned to a condition class at a feature level, with all areas of a given habitat at a given site assigned to that overall condition; (b) the condition classes “unfavourable no change” and “unfavourable unclassified” have been combined in the table; and (c) the assessment period 2010-15 runs from 1 January 2010 to 31 December 2015.
Relevance
This indicator tracks the area and condition of native woodland in Wales, and the condition of woodland on designated or ancient sites. Relevant desired outcomes of the strategy are:

- Woodland biodiversity is supported and native woodland is in favourable management
- Woodlands and trees of special conservation value are in favourable management
- Woodland management achieves high standards of environmental stewardship

The desired trends for this indicator are therefore:

a) Increasing area of native woodland
b) Improving condition of native woodland
c) Improving condition of woodland on designated sites
d) Increasing area of Plantations on Ancient Woodland Sites restored or under restoration
19. Woodland species

Key points
- The abundance of woodland birds in Wales has changed little since 1994.

Data
a) Population trends of species of principal importance

Work by Forestry Commission Wales identified 210 species from the 542 species in the Section 42 list which rely wholly or partly on woodland habitats, or that could potentially be affected by forestry operations. 26 of these species are regarded as high priority. The population trends of these species are reported through the UK Biodiversity Action Plan (UKBAP) reporting rounds.

The table below shows trends for the species for which information is available. Only a small number of species have information available (between 12 and 26 out of 210).

b) Woodland bird index

The chart below shows the change in abundance of bird species since 1994, showing that the abundance of woodland birds has risen slightly.

Chart 36: Bird species abundance by habitat

Source: Data from the Breeding Bird Survey by the British Trust for Ornithology and the Royal Society for the Protection of Birds

Relevance

This indicator tracks the population trends of woodland-related species listed in Section 42 of the Natural Environment & Rural Communities Act 2006: Species of principal importance for conservation of biological diversity in Wales. It also examines the population trends of widespread woodland birds.

One of the desired outcomes of the strategy is that woodland biodiversity is supported and native woodland is in favourable management. The desired trend in this indicator is therefore that fewer species have declining populations and more species have increasing populations.
20. Connectivity

Key points
- The proportion of woodland in network zones appears to have neither increased nor decreased overall.
- Total woodland in primary network zones amounted to 29% of the area in 2014, which is the same percentage as in 2011.
- The proportion of broadleaf woodland in key network zones has remained constant since 2011; over half the woodland in primary network zones is broadleaf.
- The proportion of conifer woodland in key network zones decreased between 2011 and 2014, but the proportion of mixed woodland in key network zones increased in this same time period.

Data

Source: Analysis of data from the National Inventory of Woodland and Trees and National Forest Inventory.

Relevance

One of the goals of the strategy is to protect the structure and functioning of woodland habitat networks and, where necessary, to reverse the fragmentation of semi-natural habitats. This indicator monitors area and type of woodland in key network zones.
21. Woodlands as a pressure on water

Key points
- This indicator is under development.

Data
This indicator is under development.

Relevance
One of the desired outcomes of the strategy is that new and existing woodlands contribute to water and soil management, through reducing any detrimental impact of woodland cover on water quality.
22. Woodlands as a solution for water management

Key points
- This indicator is under development.

Data
This indicator is under development.

Relevance
One of the desired outcomes of the strategy is that new and existing woodlands contribute to water and soil management, through reducing diffuse pollution and soil erosion and helping to reduce flood risk. The desired trends are to see:

- Increased area of riparian zones with appropriate woodland cover,
- Increased appropriate woodland covers within identified priority zones for flood risk management.
23. Heritage and landscape

Key points
- This indicator is under development.

Data
This indicator is under development.

Relevance
One of the desired outcomes of the strategy is that woodlands and trees make a positive contribution to the special landscape character of Wales and to sites of heritage and cultural importance. The monitoring of ancient woodland sites, linear features and ancient trees is dealt with under Indicator 18: Woodland habitats and ancient trees.

This heritage and landscape indicator will focus particularly on:
- The type of woodland within historic landscapes and its management,
- The extent and condition of ancient wood pasture in Wales.

Key Quality Information

1. Official Statistics are produced to high professional standards set out in the Code of Practice for Official Statistics. They undergo regular quality assurance reviews to ensure that they meet customer needs. They are produced free from any political reference.

Users and Uses

2. The Woodlands for Wales Indicators are important for monitoring the progress of the Woodlands for Wales Action Plan, and the state of Welsh forestry in general. Some of the uses include:
   - Monitoring of progress towards targets
   - Policy development
   - Advice to Ministers
   - Informing debate in the National Assembly for Wales and beyond
   - Geographic profiling, comparisons and benchmarking

   There is a variety of users of these statistics including national and local government, those involved in the forestry sector, researchers, students and individual citizens.

Data Quality

3. Where historical data are given in this report, these data may have been updated or corrected since the publication of previous reports. Any historical comparisons should therefore be made on the basis of the data contained in this report where possible.

4. In tables where figures have been rounded, the sum of the individual figures may not equal the total shown.

Data Sources and Coverage

5. Data in this report come from a variety of sources. Much of this data is published in other publications. Sources are given below, with links where further information or data can be found:
   - Forestry Statistics
   - The National Inventory of Woodland and Trees
   - The Countryside Survey
   - Forestry Commission Wales Survey of Farmers
   - Forestry Resource Survey
   - Wales Inventory of Urban Trees, available as geographic data on the Forestry Commission map browser
   - Public Opinion of Forestry surveys
   - Forest Research
   - Forestry Commission Wales Survey of Community Woodland Groups in Wales
   - Cydcoed project reports
   - Wales Outdoor Recreation Survey
   - Space for People
Related statistics for other UK countries

6. UK indicators are published in ‘UK indicators of Sustainable Forestry’, available from the Forestry Commission website.

8. Indicators for the England Biodiversity Strategy include information on woodland and are available from GOV.uk.

9. The Scottish Forestry Strategy progress indicators are available from the Forestry Commission Scotland website.
Glossary

**Active recreation**: Recreation involving activity which raises the heart rate or causes the participant to sweat. Examples would include mountain biking or trail running

**Ancient Semi-Natural Woodland (ASNW)**: Ancient woodland where the trees and shrubs are semi-natural. These are generally the most important woodlands for biodiversity

**Ancient Woodland**: Sites that have been continuously wooded since before 1600 AD

**Apparent consumption**: The amount of something used in a country or area, calculated by adding the total produced in that country or area to the amount imported and subtracting the amount exported

**Biodiversity Action Plan (BAP)**: A plan for a key habitat or species, to establish the factors for its decline and the work necessary for its recovery. National BAPs are approved by Government and form part of the overall UK Biodiversity Action Plan. The original impetus for these plans derives from the 1992 Convention on Biological Diversity

**Brownfield site**: Land previously used for industry, buildings, etc. but no longer in use for that purpose

**Canopy cover**: The proportion of an area covered by tree canopies

**Carbon abatement**: Reduction of the amount of carbon added to the atmosphere

**Carbon footprint**: A representation of the effect that human activities have in terms of the net amount of greenhouse gases, such as carbon and methane, produced, usually expressed as tonnes of carbon in the form of CO₂ equivalent

**Carbon stocks**: Carbon stored, such as the carbon locked up in trees or in wood products

**Catchment**: The area of land which contains a river system

**Clearfell**: Cutting down an area of woodland (if within a larger woodland it is typically a felling area greater than 0.25 hectares). Sometimes scattered or clumps of trees may be left standing within the felled area

**Community**: A group of people holding something in common, such as a place or interest

**Countryside Council for Wales (CCW)**: Until April 2013 was the Government’s statutory advisor on sustaining natural beauty, wildlife and the opportunity for outdoor enjoyment in Wales and its inshore waters. From April 2013, the functions of CCW have been taken over by a new body, Natural Resources Wales (NRW)
**Cydcoed**: This was a £16 million project funded by the Welsh Government and the European Union, through Objective One, engaging communities in local woodland in order to increase social, economic and environmental benefits locally.

**Diffuse pollution**: Pollution not coming from a single source.

**Ecosystem**: The interaction of communities of plants and animals (including humans) with each other and with the natural environment. Balanced ecosystems are stable when considered over the long term (hundreds of years in the case of woodland).

**Ecosystem services**: Benefits people receive from resources and processes supplied by natural ecosystems. Many studies have attempted to quantify the economic value of these services, which include:

- provisioning services, such as food, water and timber,
- cultural services, such as the provision of recreational, health and aesthetic benefits,
- regulating services, such as providing shelter, shade and cooling in towns, and shelterbelts on farmland
- supporting services, such as carbon sequestration (locking up atmospheric carbon), soil formation and photosynthesis

**Environment Agency (EA)**: Non-departmental government body aiming to protect the environment and promote sustainable development. From April 2013, the functions of the EA in Wales have been taken over by a new body, Natural Resources Wales (NRW).

**Forestry Commission (FC)**: The government department responsible for the protection and expansion of forests and woodlands in England and Scotland.

**Forestry Commission Wales (FCW)**: Until April 2013 acted as the Welsh Government’s Department of Forestry, responsible for managing the 38% of Welsh woodlands on the Welsh Government Woodland Estate. On behalf of the Welsh Government, FCW advised on the development of forestry policy and its implementation; encouraged sustainable woodland management within the private sector; administered grants; and was responsible for regulatory work, including licensing felling and replanting. From April 2013, the functions of FCW have been taken over by a new body, Natural Resources Wales (NRW).

**Forests**: Generally large areas of predominantly tree covered land.

**Forest Research (FR)**: An agency of the Forestry Commission providing research, development and monitoring services to support UK forestry, the Forestry Commission, Natural Resources Wales and the policies of the UK Government and the devolved administrations.

**Gross Value Added (GVA)**: The current recognised method of assessing the economy, and the proportion which different industries contribute towards it.

**Habitat**: An area inhabited by a particular species.
**Hardwood:** Wood harvested from broadleaved trees

**High priority species:** Species identified as being the most threatened and requiring action under the UK BAP.

**Intimate mixture:** A mixture of different tree species within a small area

**National Forest Inventory (NFI):** The successor to the National Inventory of Woodlands and Trees; a rolling national survey identifying woodland cover; woodland by ownership, and woodland by Interpreted Forest Type. A wide range of information is gathered, including tree species, age and stocking density

**National Inventory of Woodlands and Trees (NIWT):** A survey identifying woodland covered carried out in the last decade of the 20th century; 1997 is generally the reference year for this survey. This survey was the precursor to the National Forest Inventory

**Native species:** One that arrived in Wales without assistance of humans during post-glacial colonisation

**Native woodland:** Woods mainly or entirely composed of locally native species

**Natural Resources Wales (NRW):** Brings together the work of the Countryside Council for Wales, Environment Agency Wales and Forestry Commission Wales, as well as some functions of Welsh Government. Their purpose is to ensure that the natural resources of Wales are sustainably maintained, enhanced and used, now and in the future.

**Network zone:** In a woodland habitat network, woods are connected enough to function together, with exchange of individuals between woodlands.

**Open habitat:** A habitat where there is no (or limited) tree cover e.g. bog, heath and grassland

**Passive recreation:** Recreation which does not involve activity which raises the heart rate or cause the participant to sweat. Examples would include bird watching or picnicking.

**Plantation on Ancient Woodland Site (PAWS):** Former Ancient Semi-natural Woodland (ASNW) that has been more or less completely replanted with native or non-native species and the ecological value has been degraded. The degree of loss of biodiversity varies markedly with species planted and subsequent management

**Primary timber processor:** A business which undertakes the initial conversion of wood into a product.

**Priority open habitats:** Open habitats identified as threatened and subject to a UK BAP. These include upland heathland, blanket bog, lowland dry acid grassland, lowland meadows and lowland calcareous grassland
**Priority species:** Species identified as threatened and subject to a UK BAP. Priority woodland species in Wales include the spotted flycatcher, wood warbler, black grouse, bullfinch, red squirrel, dormouse and several species of bat.

**Relict hedge:** A line of trees which once formed a hedge but no longer forms a complete border.

**Riparian zone:** The area around the edge of a river, stream or other freshwater body.

**Secondary timber processor:** A business which converts one type of timber products to another.

**Semi-natural woodland:** In the UK no truly ‘natural’ woods remain. Semi-natural woodlands are mainly made up of trees and shrubs that are native to the site and are not obviously planted. They will usually have grown from natural regeneration, or from coppice/pollard growth.

**Softwood:** Wood harvested from coniferous trees.

**Soil erosion:** The removal of soil by natural processes such as water or wind.

**Special Area of Conservation (SAC):** A protected site designated under the EU Habitats Directive.

**Timber yield:** The quantity of timber produced.

**UK Forestry Standard (UKFS):** The UK government’s approach to sustainable forestry. It sets out the criteria and standards for the sustainable management of all forests and woodlands in the UK.

**Welsh Government Woodland Estate (WGWE):** Woodlands managed by Natural Resources Wales on behalf of the Welsh Government. This amounts to 38% of the woodlands in Wales.

**Windthrow:** Trees uprooted or broken by wind.

**Woodland:** Land predominantly covered by trees. In the National Forest Inventory (in the UK), woodland is currently defined as land where the mature trees would cover more than 20% by area.

**Woodland cover:** Amount of woodland, possibly expressed as an area, or as a proportion out of all the land in a country or other area.

**Woody linear feature:** Line of trees, less than 5m wide, with gaps of up to 20m and a minimum length of 20m.
