Local Authority Municipal Waste Management, 2019-20

This annual statistical release reports on the municipal waste management of local authorities in Wales in 2019-20. Although this period includes the start of the coronavirus (COVID-19) pandemic period, this is unlikely to have a significant impact on the data. In its current waste strategy ‘Towards Zero Waste’, the Welsh Government set statutory targets of recycling a minimum of 64 per cent of waste by 2019-20, and 70 per cent of waste by 2024-25. ‘Towards Zero Waste’ also includes other targets including one to reduce the total amount of household waste collected by 2050.

Please see StatsWales for additional data at a national and local authority level. A Quality Report is published alongside this document.

Chart 1: Percentage of local authority municipal waste reused/recycled/composted by year

Key points

The recycling rate (i.e. the percentage of local authority municipal waste that was reused, recycled or composted) has increased considerably during the last two decades (from around 5% in the late 1990s).

- The recycling rate (percentage of local authority municipal waste that was reused/recycled/composted) increased from 62.8 per cent in 2018-19 to 65.1 in 2019-20. This exceeds the target of 64% set in the ‘Towards Zero Waste’ Strategy.

- 18 of the 22 local authorities exceeded the 64% target.
Key points (continued)

- 17 of the 22 local authorities reported an increase in their recycling rate compared to 2018-19.

- 1.51 million tonnes of local authority municipal waste were generated in 2019-20, a decrease of almost 2.0 per cent on 2018-19.

Local authority municipal (household and non-household) that was reused/recycled/composted

The headline recycling rate is defined as: the amount of local authority municipal waste (excluding abandoned vehicles) that was sent for reuse, recycling or composting divided by the total amount of waste in tonnes collected by or on behalf of local authorities. It includes both household and non-household waste. More information about recycling rates can be found on the My Recycling Wales website.

The overall recycling rate for Wales increased from 62.8 per cent in 2018-19 to 65.1 per cent in 2019-20. The recycling rate has slowed in recent years, partly due to improvement in the accuracy of reporting (see Quality Report). The increase in 2019-20 is predominantly due to more food and wood waste being reported as recycled compared to 2018-19. Additionally, more plastic, glass and incinerator bottom ash were reported as sent for recycling.

Chart 2: Percentage of local authority municipal waste prepared for reuse, recycling or composting in Wales, 2000-01 to 2019-20

↑ The household recycling rate increased from 60.7 per cent in 2018-19 to 62.9 per cent in 2019-20.

↑ In the same period, the non-household recycling rate increased by 3.7 percentage points to 78.9 per cent.

Household waste accounts for the majority of all municipal waste collected (85.8 per cent), and therefore changes in household recycling rates have a greater impact on the overall recycling rate than the non-household recycling rate.
Under the ‘Towards Zero Waste’ strategy, the 64 per cent recycling rate target for 2019-20 has to be met by each local authority every year until it increases to 70 per cent (2024-25 onwards).

18 of the 22 local authorities met the statutory target of recycling at least 64 per cent of waste by 2019-20. The four that did not meet the target were: Powys, Caerphilly, Neath Port Talbot and Cardiff.

(a) Powys Council has identified an error in its reported recycling tonnages for 2019-20. The Council has identified that additional waste was sent for recycling during the 2019-20 scheme year than the Council reported. It is estimated that including these tonnages would have
increased the Councils recycling rate by 1 percentage point. The reporting error was identified after the end of scheme year local authority reporting deadline. Therefore the Council will report these additional tonnages as recycled in the 2020-21 scheme year subject to verification by Natural Resources Wales

- The range of recycling rates across the local authorities varied from 58.1 per cent in Cardiff to 71.7 per cent in Pembrokeshire.

- 17 of the 22 local authorities reported an increase in their recycling rate compared to 2018-19 (Chart 3).

- 5 local authorities have seen an increase of at least 5 percentage points compared to 2018-19 (-Pembrokeshire, Ceredigion, Newport, Carmarthenshire and Blaenau Gwent). These increases are related to changes in policy and practice within the local authorities. These include:
  - measures to improve the range and volume of material collected for recycling.
  - measures to restrict the volume of recyclable material placed in ‘non-recycling’ collections.
Waste generated (collected)

‘Waste generated (collected)’ is defined as waste collected directly, or from sites, by local authorities. There are sometimes differences in the amount of waste generated and the amount of waste sent for disposal by a local authority. This is due to stockpiling of waste collected in a previous year, delays in reporting across periods, inconsistencies in measurement as waste is weighed when it is collected and again when it is sent for treatment, and loss in weight through various treatment processes.

In general, the total amount of local authority municipal waste generated has gradually decreased in Wales since the early 2000’s (with some fluctuation in recent years).

Chart 4: Total local authority municipal waste generated in Wales (thousand tonnes), 2006-07 to 2019-20

- The total amount of local authority municipal waste generated in Wales decreased by 30 thousand tonnes, almost 2.0 per cent, dropping from 1,542 thousand tonnes in 2018-19 to 1,512 thousand tonnes in 2019-20 (Chart 4).
- Between 2018-19 and 2019-20, the volume of household waste generated in Wales decreased by 1.7 per cent whilst the volume of non-household waste decreased by 3.6 per cent.
- The total amount of waste generated in Wales in 2019-20 was the lowest reported to date.

Source: WasteDataFlow
As part of the ‘Towards Zero Waste’ strategy a target was introduced to reduce the total amount of household waste collected to 761 thousand tonnes by 2050. A reduction path was implemented from 2006-07 to reduce household waste by 18 thousand tonnes each year, starting in 2006-07 at 1,572 thousand tonnes, in order to reach the target. Chart 5 shows the actual amount of household waste collected compared to the reduction path.

- The amount of household waste collected gradually decreased between 2006-07 and 2019-20, from 1,572 thousand tonnes to 1,298 thousand tonnes.
- The reduction in waste collected can be seen to generally follow the reduction path.
- Initially, the reduction in waste was slightly larger than the steady decrease of the reduction path, peaking in 2011-12 when the amount of waste collected was 7.8 percentage points lower than the reduction path. However in recent years the decrease has levelled off to show a steadier reduction, aligning with the 1.2% yearly target reduction.
The material distribution this year is very similar to last year, with only minor changes for some materials.

A third of all material collected for reuse/recycling/composting in 2019-20 was ‘Organic’ material (33 per cent). Organic waste includes food, green (garden) and other compostable waste.

‘Co-mingled’ materials accounted for 18 per cent of all waste collected of reuse/recycling/composting.

Just 6 per cent of waste collected for reuse/recycling/composting was classified as ‘Plastic’ or ‘Metal’. ‘Plastic’ and ‘Metal’ make up the lowest identified material collected for reuse/recycling/composting.
‘Residual household waste’ is waste generated that is not included in separate recycling or composting collection rounds. That is, household waste that is not prepared for reuse, recycling or composting. The amount of residual household waste per person forms one component of the Wellbeing of Future generation’s indicator on waste (see Related Statistics section).

Chart 7: Residual household waste in Wales (Kilograms), 2014-15 to 2019-20

Residual household waste per person decreased by 4.0 per cent, falling from 180kg in 2018-19 to 173kg in 2019-20.

Residual household waste per dwelling also decreased by 4.0 per cent, falling from 395kg in 2018-19 to 379kg in 2019-20.

Source: WasteData Flow and Welsh Government
Waste management (sent)

‘Waste management’ data is based on the amount of waste sent for disposal/treatment, rather than the amount of waste generated (collected) by local authorities. The treatment of waste can consist of physical, thermal, chemical or biological processes, including sorting, that change the characteristics of the waste in order to reduce its volume or hazardous nature, facilitate its handling or enhance recovery.

There are sometimes differences in the amount of waste generated and the amount of waste sent for disposal by a local authority. This is due to stockpiling of waste collected in a previous year, delays in reporting across periods, inconsistencies in measurement as waste is weighed when it is collected and again when it is sent for treatment, and loss in weight through various treatment processes.

Chart 8: Waste sent for disposal/treatment by management method (%), 2012-13 to 2019-20 (a) (b)

- Between 2012-13 and 2019-20, the amount of waste sent for disposal/treatment has remained fairly stable (around 1.5 to 1.6 million tonnes). However, there have been some considerable changes in management method.
- There has been a significant decrease in the proportion of waste disposed of via landfill (falling from 42.0 per cent in 2012-13 to 7.6 per cent in 2019-20).
- In contrast, there has been a substantial increase in the proportion of waste disposed of via incineration with energy recovery (rising from 4.7 per cent in 2012-13 to 25.9 per cent in 2019-20). The percentage of waste disposed of via incineration has remained broadly the same for the past 4 years.
- Of all waste sent for disposal/treatment in 2018-19, a total of 985 thousand tonnes were reused/recycled/composted. This is an increase of 1.6 per cent on 2018-19.

(a) Chart 8 is a summary of all waste managed during the period. It uses the total waste managed as a denominator as opposed to the total waste generated, therefore recycling and landfill percentages are not directly comparable to national performance and local authority strategic indicators.

(b) In 2019-20, 0.005 per cent of waste sent for disposal/treatment was classified as Other Recovery.

Related statistics

1. UK Data: Municipal waste management statistics are also published for other parts of the UK. The Department for Environment, Food and Rural Affairs publish an annual UK Statistics on Waste data set, which includes a ‘Waste from households’ recycling rate for each UK country. This is based on a methodology that is as consistent as possible across the UK, but differs slightly from the Wales household recycling rate appearing earlier in this release. Latest data shows that the Waste from households recycling rate for Wales is considerably higher than for the other UK countries.

Chart 9: Recycling rate by UK country, 2018 (%)

Source: The Department for Environment, Food and Rural Affairs

2. Wellbeing of Future Generations: One of the national indicators relates to waste ‘Amount of waste generated that is not recycled, per person’. This is defined as the total amount (kg) of residual waste (i.e. waste that is not collected for reuse, recycling or composting) in Wales, by all sectors, on a per person basis. This indicator is calculated from three separate elements – Household waste, Construction & Demolition (C&D) Waste and Industrial & Commercial (I&C) Waste. Whilst the household element is updated quarterly, the latest Construction &Demolition and Industrial &Commercial data relate to 2012. The amount of waste generated that was not recycled, per person in 2012 was 794kg. Of the total 2,440 thousand tonnes of waste not recycled, 667 thousand was from household waste, 240 thousand from Construction and Demolition waste and 1,533 thousand from Industrial and Commercial waste.

3. Landfill Allowances Scheme: Natural Resources Wales publish an annual report on the Landfill Allowances Scheme. The purpose of the scheme is to ensure diversion of biodegradable municipal waste (BMW) from landfill. Welsh Government sets limits on the amount of BMW waste that local authorities in Wales can landfill.

4. Local Authority Recorded Fly Tipping: A summary of fly-tipping incidents, enforcement actions and prosecution outcomes is published annually by the Welsh Government.
Key Quality Information

Detailed Quality Information, including the context of the release, its uses, strengths and limitations, data processing cycle and administrative data quality assurance information are available in the accompanying Quality Report.

National Statistics status

The United Kingdom Statistics Authority (now renamed the Office for Statistics Regulation) Statistics has designated these statistics as National Statistics, in accordance with the Statistics and Registration Service Act 2007 and signifying compliance with the Code of Practice for Statistics.

National Statistics status means that official statistics meet the highest standards of trustworthiness, quality and public value.

All statistics should comply with all aspects of the Code of Practice for Statistics. They are awarded National Statistics status following an assessment by the UK Statistics Authority’s regulatory arm. The Authority considers whether the statistics meet the highest standards of Code compliance, including the value they add to public decisions and debate.

It is Welsh Government's responsibility to maintain compliance with the standards expected of National Statistics. If we become concerned about whether these statistics are still meeting the appropriate standards, we will discuss any concerns with the Authority promptly. National Statistics status can be removed at any point when the highest standards are not maintained, and reinstated when standards are restored.

These statistics had a compliance check in October 2020. The check confirmed that the release meets National Statistics. It makes recommendations for improvements. The main themes were:

- Explaining where there are differences between the different administrations in the UK and why these arise.
- Explaining more about how the government statisticians engage with users to find out about and meet user needs.
- Explaining the impact of COVID 19 on the statistics.
- Improve the accessibility of the statistics to meet the new standards that came into force on 23 September 2020.

These recommendations will be addressed during the following year to improve the next release. It will also be possible to address some by updating the quality report during the year.

Well-being of Future Generations Act (WFG)

The Well-being of Future Generations Act 2015 is about improving the social, economic, environmental and cultural well-being of Wales. The Act puts in place seven well-being goals for Wales. These are for a more equal, prosperous, resilient, healthier and globally responsible Wales, with cohesive communities and a vibrant culture and thriving Welsh language. Under section (10)(1) of the Act, the Welsh Ministers must (a) publish indicators (“national indicators”) that must
be applied for the purpose of measuring progress towards the achievement of the Well-being goals, and (b) lay a copy of the national indicators before the National Assembly. The 46 national indicators were laid in March 2016 where one relates to waste, namely ‘Amount of waste generated that is not recycled, per person’. This indicator covers the total amount (kg) of residual waste (i.e. waste that is not reused, recycled or composted) in Wales by all sectors, on a per person basis. Information included within this release is used to calculate the ‘Local Authority residual household waste’ component of the national indicator. Information on waste from the industrial and commercial sector and the construction and demolition sector are not reported in this statistical release.

Information on the indicators, along with narratives for each of the well-being goals and associated technical information is available in the Well-being of Wales report.

As a national indicator under the Act they must be referred to in the analyses of local well-being produced by public services boards when they are analysing the state of economic, social, environmental and cultural well-being in their areas.

The statistics included in this release could also provide supporting narrative to the national indicators and be used by public services boards in relation to their local well-being assessments and local well-being plans.

Glossary

Co-mingled
Recyclate consisting of different types of recyclable materials that are mixed together or unsorted such as paper, metal, plastic and glass.

Composting
An aerobic, biological process in which organic wastes, such as garden and kitchen waste, are converted into a stable granular material which can be applied to land to improve soil structure and increase the nutrient content of the soil.

Compost-like output
When mixed municipal solid waste is biologically treated in Mechanical Biological Treatment (MBT) plants, the output is known as a 'compost-like-output'.

Dry recycling
The recycling of dry materials, such as paper, card, cans, plastic bottles, mixed plastic and glass.

Household waste
Materials collected directly from households (kerbside collections), taken to bring sites (including civic amenity sites) or collected by private and voluntary organisations not included elsewhere.

Incinerator bottom ash
The ash that is left over at the bottom of an incinerator after waste is burnt.

Landfill sites
Any areas of land in which waste is deposited are termed landfill sites. They are often located in disused mines or quarries. In areas where these are limited or no ready-made voids exist, the practice of landraising is sometimes carried out; waste is deposited above ground and the landscape is contoured.

Local authority municipal waste
Household and non-household waste that is collected and disposed of by local authorities. It includes regular household collections, specific recycling collections, special collections of bulky items, waste received at civic amenity sites and waste collected from non-household sources (e.g. rubble, incinerator residues, matter from beach cleansing and plasterboard). Local authority municipal waste excludes abandoned vehicles.

Non-household municipal waste
All waste collected by an authority or its contractors, other than wastes within Schedule 1 and 2 of the Controlled waste Regulations 1992. This includes any other wastes collected by an authority, such as municipal parks and gardens waste, industrial or commercial waste and waste resulting from the clearance of fly-tipped materials.

Organic
Organic waste includes food, green (garden) and other compostable waste.
Preparation for re-use
Local authority municipal waste is prepared for re-use for the purpose of the targets when:

(a) a waste product or component of a waste product has undergone a checking, cleaning or repairing recovery operation; and

(b) the waste product or component of a waste product can be re-used for its original purpose.

Recycling
Any recovery operation by which waste materials are reprocessed into products, materials or substances, whether for the original or other purposes. It does not include energy recovery and the reprocessing into materials that are used as fuels of backfilling operations.

Residual waste
Waste that is not prepared for reuse, recycling or composting.

Reuse
The use of household waste removed from the local authority collected municipal waste stream (e.g. furniture from households, including that collected on behalf of a local authority by third parties) for its original or a different purpose, without processing or treatment in a waste recovery operation, other than one which has the purpose of repairing or refurbishing the household waste.

Reuse/recycling/composting rate (statutory target definition)
Percentage of local authority municipal waste generated that is recycled, reused or composted, calculated at time of distribution to landfill or recycling/composting contractors. This is, therefore, based on the amount of waste sent for reuse, recycling or composting, rather than collected for the purpose of being reused, recycled or composted.

Treatment
Physical, thermal, chemical or biological processes, including sorting, that change the characteristics of the waste in order to reduce its volume or hazardous nature, facilitate its handling or enhance recovery.
